Software Module for Multiple Sampling Rates per Channel for HiRES Advanced, Type HiRES Advanced BlockMode

Application

The software package HiRES Advanced BlockMode is an extension module for the HiRES Advanced main software module. It is used for recording measurement data with multiple sampling rates per channel, and for display of such data. This feature is useful when slow-changing signals shall be measured over a longer period with a low sampling rate to save memory, but for part of the time contain transients that require a higher sampling rate.
